### A LOOM

### for every woven fabric

ROM the narrowest lingerie ribbon, a fraction of an inch in width, to 480-inch wide felt—from a tissue nainsook to a thick luxurious carpet—from softest cotton, silk or vegetable fibres, to harsh threads—linen, asbestos and even metal—whatever the textile, for whatever purpose, the Crompton & Knowles Loom Works design and build looms especially adapted to its weaving.

Through the years new looms have been designed and perfected—new devices added to closer approximate ideal efficiency for varied purposes. Dependability, endurance, and economy are outstanding features.

Whatever your weaving requirements, the Crompton & Knowles Loom Works are ready with complete weaving equipment—with supply parts ready for emergency—and the will to serve.

### "We must equip to meet new conditions"

### The Treasurer:

"But why, Mr. Superintendent? I've just compared our last report with older records. And I find that our operating performance is better than it's ever been. How can you say we're losing money because our equipment is n't up-to-date?"

### The Superintendent:

"Yes, Mr. Treasurer, but you're judging our present operating performance with the standards of 1896.

"By our old records of performance, we're getting 92 per cent production in spinning and carding. But 1931 standards are based on long draft, coarser rovings, better spindles and larger packages. That's what you'll find in our competitors' mills. And that's why we're getting only 68 per cent of our competitors' production.

"Take another example, Mr. Treasurer. We're mighty proud of our 99 per cent efficiency in our weave shed. But our looms are running at 132 picks per minute. And our competitors are getting 99 per cent efficiency with their looms running at 165 picks because of stronger and better yarn. So you see, our 99 per cent does n't look so good.

"That's where we're losing money I'm sure of it. We suffer in competition because our operating performance is far below our competitors'."

### The Treasurer:

"H-m-m-m — you may be right. It sounds pretty logical to me. But we don't want to load up with new equipment until we're sure

### The Superintendent:

"Exactly, Mr. Treasurer. We've got to know where we are heading before we start. I suggest a survey of our present equipment and operating methods. That will show us what new equipment we need and what we can conservatively expect to save per year. I know that 25 per cent savings per year on the investment is not at all unusual. And that pays for the new equipment in four or five years. Of course, the big thing is that it puts us in position to meet competition on an even footing. We must equip to meet new conditions."

### The Treasurer:

"Go ahead with the survey, Mr. Superintendent. We'll put it before a board meeting when you're ready. I think we're on the road to a healthier income statement."

The staff of this mill co-operated with Saco-Lowell engineers in making the survey. The suggestions for improvement were approved by the board, and new machinery has been installed.

We'll gladly work with any mill to determine their added costs due to the operation of obsolete equipment. Write us, without the slightest obligation.

### The BARBER-COLMAN Way

of Automatic Spooling and Warping

Results in

### **Lower Operating Costs**

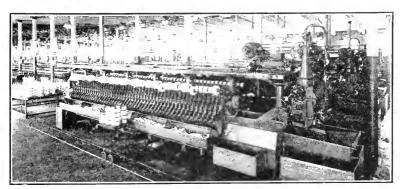

In analyzing the merits of various spooling and warping systems it is well to remember one proven fact, that the real improvements in the warp are made in the Automatic Spooler and not in the Warper as many are led to believe. Perfect weaver's knots, elimination of kinks, efficient yarn clearers, and running the yarn without artificial tension at the Barber-Colman Automatic Spooler go farther toward making perfect warps and reducing operating costs than any benefits that may be obtained through the use of any other spooling or winding and warping system.

### Service to the Textile Industry

G-E specialists in the application of electric equipment used in the textile industry are located in principal cities. They are prepared to coöperate with mill executives, architects, and engineers in the design and construction of textile manufacturing plants to make proper provision for electric power. They also assist mill engineers and others responsible for the successful operation of the equipment.

Manufacturers of textile machinery and equipment also receive cordial coöperation from the General Electric Company in developing the electrical features of their machines. This also accrues to the benefit of the mill owner by enabling him simply to specify G-E equipment when purchasing machinery.

Throughout the textile industry today G-E motors and control, developed especially for mill machinery, are increasing production, and providing the various other advantages of electric drive. In close coöperation with mill owners, the General Electric Company has met each new problem, advising as to the utilization of complete electric equipment.

### PREFACE

The subject matter in this edition of the Year Book is essentially that covered in the previous edition. Changes in the statistics collected make new material available each year and at the same time necessitate the elimination of tables that cannot be brought up to date.

The activity of the cotton finishing industry, and the prices of gray cloth in the Osaka market, are omitted from this edition as no figures have been collected since 1929.

Credit for source has been given in most instances, but where composite tables are used it is not always possible.

The Association is particularly indebted to the Government authorities in this country and abroad for their generous co-operation in supplying the data for many of the tables.

Any suggestions our members may have on how the book could be made of more value to them are solicited.

> RUSSELL T. FISHER, Secretary.

### REVIEW OF LAST EIGHT AMERICAN COTTON CROPS

1930-31.Of the 46,078,000 acres of cotton in cultivation on July 1, 45,091,000 acres were harvested with a yield per acre of 147.7 pounds, or a total of 13,931,597 bales of 500 pounds gross. This compares with a yield of 155.0 pounds and a total crop of 14,544,584 bales for the previous year. The yield per acre is the lowest since the 1923 crop, when the yield was estimated at 130.6 pounds per acre.

The growing season was not favorable in large areas. The month of May was a little too wet over a large portion of the belt, but in June the rainfall was below normal. During July unusually hot, dry weather prevailed in most of the belt from Alabama west, amounting to severe drought in many sections, especially in Arkansas and Louisiana.

Deficient moisture was responsible for more than half the reduction in yield, being reported at 27.7 per cent, while boll weevil damage was very low, being reported at 5.0 per cent.

The quality of the 1930 crop was better than the 1929 erop, with 84.6 per cent of the crop tenderable on futures contract, compared to 75.7 per cent of the 1929 erop. Of the total tenderable, 10,485,100 bales or 76.4 per cent were  $\frac{7}{8}$  inch to  $\frac{11}{32}$  inch, while 1,411,400 bales or 10.2 per cent were over  $\frac{11}{32}$  inch. The average of the crop was about middling for grade.

The estimates of the crop, both departmental and private, were consistently high, and varied more from the final yield than in the previous two seasons. The large carryover of American cotton, estimated at 5,939,000 bales, poor general business conditions, and a limited demand for cotton on the part of the mills tended to minimize any effect the variations in the predicted crop might have had on the market.

### REVIEW OF 1922-1930 COTTON CROPS

The cotton crop for the year 1922–23 was the second successive small crop with a yield of 9,762,069 bales from 33,036,000 acres. Weather damage in the southwest and weevil damage in the east were held accountable for the low yield.

The next year, 1923–24, the acreage was increased to 37,123,000 but too much rain in the east and a severe drought in the western part of the belt kept the yield down to a total of 10,139,671 bales.

The 1924–25 season started unfavorably but more favorable weather later in the season plus an almost ideal picking season gave a crop of

13,627,936 bales from 41,360,000 acres. The boll weevil was not much of a factor. Bureau estimates were on a semi-monthly basis.

The hot, dry weather in 1925–26 caused the abandonment of the crop in parts of Texas but kept weevil damage at a minimum with a final crop of 16,103,679 bales from 46,053,000 acres. Large quantities of low grades were produced.

The cotton crop of 1926–27 was the largest in history with 17,977,374 bales from 47,087,000 acres. The size of the crop was badly underestimated until the middle of October. The crop as a whole was low grade with sledge cotton an appreciable factor. Bureau estimates included a high, low and average yield.

In 1927–28, the acreage was reduced to 40,138,000 and the final yield of 12,956,043 bales was very close to the all-season prediction by the Bureau. Floods in the Mississippi valley caused much uncertainty and cut the production from that section about 1½ million bales. The weevil damage increased over recent years and was estimated to have destroyed 18.5 per cent of the crop. Bureau estimates monthly from August to December, inclusive.

The final ginning figures for the 1928–29 season show 14,477,874 bales from 45,341,000 acres. The Bureau estimates showed little variation through the season and were consistently close. The weevil damage was estimated to have destroyed 14.1 per cent of the crop.

Two new reports were inaugurated by the Bureau during the season—the domestic consumption by grade and staple for year ending July 31, 1928, and the grade and staple of the crop as ginned.

1929-30. After a comparatively uneventful growing season, with an acreage of 48,457,000 acres yielding 155 pounds of lint to the acre, or a total of 14,544,584 bales, the market was badly upset by the stock market crash and consequent slowing up of world business. For the second successive year the Bureau estimates were consistently close to the final yield.

### Computation of Cotton Crop Condition

The following statement from the Bureau of Agricultural Economics outlines the method used to obtain the government cotton crop condition estimate:

The condition figures published by this Bureau are based upon a normal condition. A normal condition is such a condition as would be expected at the date to which the report relates if conditions are favorable to the crop; that is to say, assuming that good seed had been planted under favorable conditions and that the crop had not suffered material injury from drought, storms, insect pests, plant diseases, or other unfavorable influences. Normal is not an ideal condition, but represents something rather close to the average of good years. The bearing of condition is upon final yield per acre rather than upon total production, because condition does not involve the question of acreage.

The yield per acre to be expected from a condition of 100 per cent or normal for any month is determined each year by a study of the relation of condition in that month to final yield in previous years. The reported per cent of a normal June 25 condition would, of course, indicate a corresponding per cent of the established normal yield per acre for June 25. This promised yield per acre, being multiplied by the number of acres, gives an indication of total production. All such forecasts are based upon the assumption that conditions affecting the crop developing after the date of report will be average and that the final yield will prove greater or less than the forecast according as such future influences prove more or less favorable than in an average year.

A condition in June of 71 would not necessarily indicate the same production as the same figure for the following month because conditions average higher in June than in July for most crops, and distinctly so for cotton. The comparison each month is with normal conditions for that month. While the conditions of 71 per cent normal in June might be 80 per cent of the June average condition, the same per cent of July normal might be 90 per cent of July average condition and indicate a correspondingly higher yield.

### Average Grades of Recent Cotton Crops

Henry G. Hester, Secretary of the New Orleans Cotton Exchange, computes the average grades of recent American cotton crops to have been as follows:

1917-18, middling.

1918-19, barely middling.

1919-20, strict low middling.

1920-21, barely middling.

1921–22, middling.

1922–23, middling.

1923-24, strict low middling to middling.

1924-25, middling.

1925–26, strict low middling. 1926–27, strict low middling to middling.

1927-28, middling to strict middling.

1928-29, strict low middling to middling.

1929-30, strict low middling to middling.

1930-31,1 middling.

<sup>&</sup>lt;sup>1</sup> According to cotton grade and staple report.

<sup>1</sup> According to the Bureau of the Census, which on March 20, 1931, reported 13,753,883 bales, including 23,254 bales American-Egyptian ginned during the crop year. Figures above rounded to nearest hundred bales.

<sup>1</sup> Percentages computed to the nearest ope-tenth of one per cent.

<sup>3</sup>Less than one-tenth of one per cent.

<sup>4</sup> Includes all bales not otherwise classified above.

<sup>\*</sup> Uncoderable in settlement of futures contracts made subject to Section 5, U. S. Cotton Futures Act and the regulations of the Secretary of Agriculture thereunder.

1 Average is weighted and includes cotton States in which there was no damage by boll weevil

The above chart is based on the table on the following page.

1 = In public storage and at compresses

2 = In consuming establishments

# United States Stocks of Cotton in Consuming Establishments, in Public Storage and at Compresses

[American cotton is counted in running bales; foreign cotton, in equivalent 500-pound bales]

### Linters are not included

The table below does not include cotton in transit in private storage or on plantations. It embraces merely the cotton in consuming establishments, in public storage and at compresses, as compiled monthly by the United States Bureau of the Census.

### Carry-over of Cotton

The term "carry-over" has several meanings. It may refer (1) simply to cotton held in the United States, or (2) American cotton held anywhere in the world, or (3) all kinds of cotton held anywhere in the world. Statistics of carry-over as issued by trade authorities differ widely from each other each year, not only because of the various meanings of the term, as just stated, but also because some authorities count the carry-over in running bales, disregarding the fact that Egyptian bales, for example, weigh approximately 750 pounds and Indian bales only 400, while others compute the quantities of foreign cottons in equivalent 500-pound bales, and some authorities include American linters while others do not.

Following are statistics of the amount of cotton carried over from each season for several years past, as computed, on different bases, by leading authorities.

### World Carry-over of American Cotton

The table below was compiled by Henry G. Hester, Secretary of the New Orleans Cotton Exchange. It includes all American cotton held in the American cotton belt,—i.e., at southern mills, at counted and uncounted interior towns, and on plantations,—stocks at northern mills and at the ports of the United States, and stocks at European ports and at European mills. This embraces practically all American cotton held anywhere in the world. The only stocks not included in this table are those in Japan and scattering stocks in the less important manufacturing countries where some American cotton may be found, such as Canada and Mexico. The cotton is counted in running bales, round bales being counted as half bales.

### World Supply and Consumption of American Cotton

The tables below, compiled by Henry G. Hester, Secretary of the New Orleans Cotton Exchange, show the world supply and consumption of American cotton, inclusive of linters, season by season since 1916–17. In considering these statistics it should be borne in mind that they relate only to American cotton. They do not include Egyptian, Indian or other foreign growths. The figures of supply at the beginning of each season include mill stocks in the United States and Europe, stocks at counted and uncounted interior towns and on plantations in this country and stocks at ports in this country and Europe. The statistics on consumption include consumption in this country and abroad. These statistics are in running bales.

### Supply and Consumption, including Linters

	n Sea to Ju		Supply at Beginning of Season	Crop	Total Supply for Season	Consumption

### United States Cotton Production, Consumption, and Active Cotton Spindles

[Running bales, except those for production in 1850, 1860, and 1870, which are in equivalent 400-pound bales, and those for consumption from 1840 to 1870, and for foreign cotton, which are in equivalent 500-pound bales. Linters are not included except for quantities consumed in 1909 and years prior thereto.]

Note.—This table shows only the destination of the cotton as given when the cotton was shipped from Egypt. Some of the cotton was reshipped from these countries of initial destination and was finally consumed in other countries; for example, some of the cotton reported here as taken by Great Britain was reshipped by the latter to the United States.

### United States Production, Consumption, and Exports of Cotton and Linters

The statistics below are in running bales except that round bales are counted as half bales and foreign cotton in equivalent 500-pound bales. The years as given are the official cotton seasons. Through 1913-14 the seasons were from September 1 to August 31. Starting with 1914-15, they have been from August 1 to July 31.

<sup>1</sup> Cloth exports are in square yards.

NOTE. - Where no figures are given for the earlier years the items were either not compiled or not separately classified in those years. If compiled, they were grouped with other items shown in the table. It should not be assumed that there were no exports of such items if no figures are given for these items separately.

Nore.—Where no figures are given for the earlier years the items were either not compiled or not separately classified in those years. If compiled, they were grouped with other items shown in the table. It should not be assumed that there were no exports of such items if no figures are given for these items separately. Conversely figures for certain classes of goods (as for all other cloths, colored) are discontinued when this classification is broken up into several sub-classifications, all other cloths, colored, being subdivided into printed, dyed in the piece, and dyed in the yarn.

United States Exports of Cotton Manufactures, by Countries

<sup>2</sup> In June, 1918, the government announced a list of maximum prices on cotton goods. These prices were really in effect till the end of the year. After the armistice in November, however, business almost ceased and there was practically no market. This may explain some figures which would otherwise seem irregular. 1 This average includes, among others, eight print cloths, five sheetings, four drills, four standard colored goods, four bleached goods and two ducks.

Average Yearly Standard Colored Goods and Bleached Goods Prices

<sup>&</sup>lt;sup>1</sup> Blackburn list succeeded by Uniform list in 1892.

<sup>&</sup>lt;sup>1</sup> Blackburn list succeeded by Uniform list in 1892.

Strippers and grinders, blowing-room operatives, and leading men in cotton rooms received in 1920 an additional 10 per cent on wages realized after the addition of the 70 per cent of the list.

Tapers, dry tapers, warp dressers, and loom overlookers received an advance in 1920 of only 55 per cent of list, instead of the 70 per cent which other operatives received. In 1921 these operatives were reduced only 55 per cent instead of the 70 per cent by which other workers were cut down.

Heavier than 150 demer:			10 000 004
Pounds		3	
Value			\$18,175,240
Allied products (sheets, waste, etc.), value			\$8,699,512
Value added by manufacture <sup>4</sup>		\$84,140,544	\$116,215,854

<sup>&</sup>lt;sup>1</sup> Not including salaried employees. The average number of wage earners is based on the numbers reported for the several months of the year. This average somewhat exceeds the number that would have been required for the work performed if all had been continuously employed throughout the year, because of the fact that manufacturers report the numbers employed on or about the 15th day of each month, as shown by the payrolls, usually taking no account of the possibility that some or all of the wage earners may have been on part time or for some other reason may not actually have worked the entire month. Thus in some cases the number reported for a given month exceeds the average for that month.

<sup>&</sup>lt;sup>2</sup> Manufacturers' profits can not be calculated from the census figures because no data are collected for certain expense items, such as interest on investment, rent, depreciation, taxes, insurance and advertising.

<sup>&</sup>lt;sup>3</sup> Not reported separately.

<sup>&</sup>lt;sup>4</sup> Value of products less cost of materials, containers for products, fuel and purchased electric current.

<sup>&</sup>lt;sup>1</sup> There is no uniform currency in China, the Mexican silver dollar being mostly used. The British dollar, termed Hongkong currency, has the same legal value as the Mexican dollar in Hougkong and the Straits Settlements, and usually prevails at about 30 cents United States gold.

Note.—Foreign money values are all subject to fluctuations.

#### Weight Equivalents

Corrected to second decimal place

```
1 ounce = 437.5 grains = 28.35 grams
1\frac{1}{2} ounces = 656.25 grains = 42.52 grams
2 \text{ ounces} = 875.0 \text{ grains} = 56.70 \text{ grams}
2\frac{1}{2} ounces = 1093.75 grains = 70.87 grams
3 ounces = 1312.5 grains = 85.05 grams
3\frac{1}{2} ounces = 1531.25 grains = 99.22 grams
4 ounces = 1750.0 grains = 113.40 grams
4\frac{1}{2} ounces = 1968.75 grains = 127.57 grams
5 ounces = 2187.5 grains = 141.75 grams
5\frac{1}{2} ounces = 2406.25 grains = 155.92 grams
6 ounces = 2625.0 grains = 170.10 grams
6\frac{1}{2} ounces = 2843.75 grains = 184.27 grams
7 ounces = 3062.5 grains = 198.44 grams
7\frac{1}{2} ounces = 3281.25 grains = 212.62 grams
8 ounces = 3500.0 grains = 226.79 grams
8\frac{1}{2} ounces = 3718.75 grains = 240.97 grams
```

#### Reference Data

Millimeters  $\times$  .03937 = inches or millimeters  $\div$  25.4 = inches.

Centimeters  $\times .3937 = inches$  or centimeters  $\div 2.54 = inches$ .

Meters  $\times 39.37 = inches$  or meters  $\times 3.281 = feet$ .

Kilometers  $\times$  .621 = miles.

Square centimeters  $\times .155 = \text{square inches or square meters} \times 10.764 = \text{square feet}$ .

Cubic meters  $\times 35.315$  = cubic feet or cubic meters  $\times 1.308$  = cubic yards.

Liters  $\times .2642 = \text{gallons}$  (231 cubic inches).

 $Grams \times 15.432 = grains \text{ or } grams \div 28.35 = \text{ ounces avoirdupois.}$ 

Kilograms  $\times 2.2046$  = pounds or kilograms  $\div 907.2$  = tons (2,000 pounds).

Kilowatts $\times 1.34$  = horse power or watts  $\div 746$ . = horse power.

Calorie  $\times 3.968 = British Thermal Unit.$ 

1 Pint of water weighs 1.045 pounds.

1 Gallon of water = .1339 cubic feet = 8.36 pounds of water at 62° F.

1 Mile = 5,280 feet.

1 Pound (avoirdupois) = 7,000 grains = 453.6 grams.

1 Horse Power = 33,000 foot pounds of work done per minute = 746 watts.

The pressure of one atmosphere = 14.7 pounds per square inch, = 2,116 pounds per square foot, = a column of mercury 760 millimeters high.

A column of water 2.3 feet high corresponds to a pressure of 1 pound per square inch.

Note.—The above figures are only approximate, but they give a fair average of the power required to drive the various machines. The speed production and many other conditions affect the power consumed. For Friction of Belting and Shafting add from 18 to 22 per cent.

#### Conversion Table of Cotton Yarn Numbers

#### Spinning Frame Production

To find 100 per cent Production per Spindle, in Pounds, from Speed of Front Roll:

EXAMPLE:

$$\frac{3.1416 \times 90 \times 60 \times 54}{36 \times 840 \times 52}$$
 = .582 lbs. per spindle.

### **Roving Frame Production**

To find 100 per cent Production of Roving Frames, in Hanks, from Speed of Front Roll:

Example: Assume speed of front roll 80 r. p. m.

Assume Circum, of front roll 3.927 inches.

$$\frac{3.927 \times 80 \times 60 \times 54}{36 \times 840} = 33.66$$
 Hanks per spindle.

#### Yarn Number

To find the yarn number or count:

$$\frac{\text{Number of yards in Sample x Grains in a Pound}}{\text{Weight of sample in grains x standard}} = \text{Yarn Number}.$$

Or for cotton yarn using a 120 yard skein:

$$\frac{120 \times 7,000}{\text{Weight of sample x 840}} = \frac{1,000}{\text{Weight of sample in grains}} = \text{Yarn Number.}$$

# Square Root of the Numbers or Counts, from One to Two Hundred Hanks in the Pound, with the Twist per Inch for Different Kinds of Yarns

The heavy figures opposite No. 1 show the multipliers for the square root of all numbers throughout the tables.

Counts or Numbers	Square Root	Ordinary Warp Twist	Low Warp Twist	Ordinary Mule Twist	Filling Twist	Ordinary Hosiery Twist	Medium Hosiery Twist

#### Table for Use in Converting Linear Yards into Square Yards

Bureau of Census

The following table is made out in parallel columns. The first column refers to the width, in inches, of the woven products while the opposite figure represents the "equivalent" in square yards.

To convert linear yards to square yards, take the "equivalent" opposite the number representing the width in inches and multiply by the number of linear yards. Example: To convert 1,386,520 linear yards of cloth  $38\frac{1}{2}$  inches wide into square yards — the "equivalent"  $c^{\ell}$   $38\frac{1}{2}$  inches is 1.069, which multiplied by 1,386,520 gives 1,482,190 square yards.

Width in	Equiv- alent Square	Width	Equiv- alent Square	Width	Equiv- alent Square	Width	Equiv- alent Square	Width in	Equiv- alent Square	Width in	Equivalent Square

#### SOUND HUMIDIFYING PRACTICE\*

#### **Evaporative Capacity Required**

The capacity of a humidifier system should be sufficient to evaporate water at a rate which will produce the required relative humidity in every department even when window transoms are opened sufficiently to avoid discomfort to operatives during the hottest weather which commonly prevails in summer. Humidifiers should have sufficient evaporative capacity to maintain relative humidities not less than and dry bulb temperatures not greater than the following:

For Weaving	85% relative humidity at 84° F.
Spinning and Twisting	$\begin{cases} \text{ from } 55\% \text{ at } 90^{\circ} \text{ F. to} \\ 70\% \text{ at } 87^{\circ} \text{ F.} \end{cases}$
Spooling, Winding, Warping and Room	_
Carding, Combing and Roving.	$ \begin{array}{c} \cdot \\ \cdot \\ \cdot \\ \cdot \\ \cdot \\ \cdot \\ \cdot \\ \cdot \\ \cdot \\ \cdot \\$

Outside conditions of temperature and humidity to be expected during typically hot weather in a locality should be carefully determined by a competent engineer and specified in terms of dry bulb temperature and wet bulb depression.

#### Recommendations to Purchasers

In considering the purchase of equipment, the owner or his engineer should first state specifically the scale of humidities and temperatures above recommended or its proper equivalent.

Final tenders in the form of contract proposals should be taken up for decision only after all competing bids have been reduced to identical specifications.

Any tender in which the evaporative capacity specified and guaranteed is materially less than the rest must be regarded as representing correspondingly low value. Evaporative capacity which can be relied upon is the only safe yardstick for comparing values in installations of distributed humidifiers. Tenders should therefore be carefully compared not only in respect to gross cost of installation and maximum power consumption but also in respect to cost of installation and power consumption per gallon of capacity. Guaranteed delivery of the stipulated evaporative capacity and that power consumption will not exceed a specified maximum are essential to protection of the purchaser.

If the apparatus finally purchased should fail to deliver the guaranteed capacity, the contractor should not only furnish such additional apparatus as may prove necessary to attain the capacity at his own expense, but should also be properly penalized if power consumption is thereby increased beyond the specified maximum.

<sup>\*</sup>See complete Report of the Committee on Humidifying Practice, October, 1929.

## United States Government General Specification for Textile Materials (Methods of Physical and Chemical Tests)

F. S. B. Specification No. 345A.

#### I. General Statement

These methods were prepared for use in making determinations on the requirements specified in textile specifications promulgated by the Federal Specifications Board, so that variations introduced by different test methods may be eliminated. They are not intended to include all the textile-test methods in use in the textile industry.

Additions and revisions will be made as the necessity arises.

The word "fabric" as used herein applies only to woven fabrics except where otherwise specifically stated.

#### II. Atmospheric Conditions

Physical tests may be made under prevailing atmospheric conditions except in the settlement of disputes where moisture is an influencing factor in tests for breaking strength, thread count, weight, width, length, etc. Such tests shall then be made upon material having normal moisture content, obtained by exposure for at least four hours to an atmospheric condition of 65 per cent relative humidity at 70° F.

The effect of humidity is a decided variable in these tests, depending on the construction, finishing, sizing, etc. In general, a high relative humidity will increase all weight results, and in breaking-strength results will show an increase for vegetable fibers and a decrease for animal fibers. The manufacturer should note the humidity on a sling psychrometer at the time tests are made to establish whether his material conforms to these specifications and take into consideration the above facts.

#### III. FIBER IDENTIFICATION AND QUANTITATIVE DETERMINATIONS

- 1. Cotton.—In specifications calling for cotton fibers no further test is needed than the visual or microscopical examination of the fibers as pulled from the specimen.
- 2. Wool.—Boil not less than a 5 g specimen in not less than one hundred times its weight of a 5 per cent solution of either sodium or potassium hydroxide for not less than 10 minutes. If any residue remains, examine it for its nature and amount. The presence of fibers other than wool in excess of 1 per cent shall be cause for rejection.
- 3. MIXTURES OF WOOL AND COTTON.—(a) Cotton warp-wool filling.—Remove the cotton warp and test the filling for wool as in Section

- III, 2. If a limit as to the proportion of cotton is given, test as in Section III, 3, (b).
- (b) Cotton-wool mixtures.—Remove the sizing and finishing materials by (1) extracting in ether, (2) boiling in distilled water for 10 minutes, (3) treating in a hot (90° to 95° C.) solution of sodium carbonate (0.5 per cent) for 30 minutes, (4) rinsing in distilled water, (5) immersing in a hot (85° to 90° C.) solution of hydrochloric acid (0.5 per cent) for 30 minutes, (6) rinsing in distilled water, (7) neutralizing in a 1 per cent solution of sodium carbonate at room temperature, (8) rinsing thoroughly in distilled water and drying. All weighings shall be made after the specimen has been conditioned at 65 per cent relative humidity and 70° F. Weighings shall be made to the nearest milligram or equivalent accuracy. Boil (gently) the specimen in at least one hundred times its weight of a 5 per cent solution of potassium hydroxide for 10 to 15 minutes. Rinse in hot distilled water, then in a 5 per cent solution of acetic acid and again in distilled water. Filter. (The use of either a Buechner funnel attached to a suction flask or a Gooch crucible is desirable.) Dry in air. Condition. The per cent of cotton present shall be calculated as follows:

$$\frac{\text{Residue weight} \times 100}{97} = \text{Weight of cotton}$$

$$\frac{\text{Weight of cotton} \times 100}{\text{Original weight of specimen}} = \text{Per cent of cotton.}$$

## IV. Breaking Strength, Grab Method (1 by 1 by 3 inches)

Specimens 6 inches long by 4 inches wide shall be cut 3 to 5 in the direction of the warp and 3 to 5 in the direction of the filling, respectively. Care shall be taken that no two test specimens include the same threads, except for retest as specified below. No specimen for testing should be taken nearer the selvage than one-tenth the width of the material.

The machine used shall be of the inclination balance type. The limits of capacity of the machine shall be such that the angle of swing of the pendulum shall be under 45° from the vertical and over 4° from the vertical. The lower or pulling jaw shall travel at a uniform rate of 12 inches per minute under no load. The distance between jaws shall be 3 inches at start of test. The inside or back half of each jaw shall be 2 inches or more in width; the other half shall be 1 inch in width. Jaws shall have a smooth and flat surface with edges slightly rounded to prevent cutting. The results of the test of each direction shall be averaged. If a specimen slips in the jaw, breaks in the jaw,

breaks at the edge of the jaw, or for any reason due to faulty operation the result falls markedly below the general average, the result shall be disregarded, another specimen taken from the same threads, and the result of this break included in the average.

#### V. Breaking Strength, Strip Method

Test specimens approximately 6 inches long by "a" inches (see Table 1) wide shall be cut, 3 to 5 in the direction of the warp and 3 to 5 in the direction of the filling, respectively.

TABLE	1	Widt	h of	spec	imen	befo	re ra	veling	g (stri	method	<i>l</i> )
Threads per inc	h									Width	"a"—Inches
Over 80											11/8
50 to 80											11/4
Under 50											$1\frac{1}{2}$

Each specimen shall be raveled to exactly 1 inch by taking from each side approximately the same number of threads. Care shall be taken that no test specimens include the same threads, except for retest, as specified below. No specimen for testing should be taken nearer the selvage than one-tenth the width of the material.

The machine used shall be of the inclination balance type. The limits of capacity of the machine shall be such that the angle of swing of the pendulum shall be under 45° from the vertical and over 4° from the vertical. The lower or pulling jaw shall travel at a uniform rate of 12 inches per minute under no load. The distance between jaws shall be 3 inches at the start of the test. The width of the jaws shall be 1½ inches or more. Jaws shall have a smooth and flat surface with edges slightly rounded to prevent cutting. The results of the tests in each direction shall be averaged. If a specimen slips in the jaw, breaks in the jaw, breaks at the edge of the jaw, or for any reason due to faulty operation the result falls markedly below the general average, the result shall be disregarded, another specimen taken from the same threads, and the result of this break included in the average.

## VI. WEIGHT PER SQUARE YARD

The weight per square yard may be determined by any one of the following three methods. In case of dispute method No. 1 shall be used as an umpire method and the length shall be a cut, roll, or bolt.

Method No. 1.—Take a measured portion of the material and weigh. Calculate from this area the weight per square yard. Average 3 to 5 tests.

Метнор No. 2.—Cut from the sample a specimen 2 by 2 inches using a steel die. No specimen for testing shall be taken nearer

the selvage than one-tenth of the width of the material. Weigh on a balance adjusted to read the weight of the material in ounces per square yard. Average 3 to 5 tests.

Method No. 3.—Take 1 yard of the sample. Weigh, and if the width is not 1 yard calculate the weight per square yard. Average 2 tests.

#### VII. Weight Per Linear Yard

The weight per linear yard shall be computed from the weight per square yard, as follows:

$$\frac{\text{Weight per square yard} \times \text{width}}{36} = \text{Weight per linear yard.}$$

#### VIII. THREAD COUNT

The actual number of threads in 1 inch of width shall be counted in each direction at 3 to 5 different places in the cloth and the results averaged for each direction. Where the thread count is under 25, the actual number of threads in 3 inches shall be counted for each direction at 3 to 5 different places in the cloth and the results reduced to threads per inch and averaged for each direction. When the size of the sample permits, these counts shall be taken about 6 inches apart. No warp reading should be taken nearer the selvage than one-tenth the width of the fabric.

When the fabric is 3 inches wide or less all the warp threads shall be counted and the results calculated to threads per inch.

#### IX. WIDTH

The width shall be determined by laying the material on a flat surface without tension, then measuring the distance perpendicular to the length from edge to edge to an accuracy of one-sixteenth inch. Three to five measurements shall be taken at different places in the sample and the results averaged.

#### X. Fastness Tests

- 1. Fastness to Light.—The specimen shall be subjected to one of the following tests. In case of dispute method (a) shall be used.
- (a) Exposure for 48 hours to a carbon arc lamp which is operated on a 220-volt circuit with a power input of approximately 2,700 watts.
- (b) Exposure for 48 hours to a mercury vapor lamp, with glass between light and specimen, which is operated on a 200-volt circuit with a power input of approximately 400 watts.

- (c) Exposure for 30 days continuously at an angle of 45° from the horizontal position facing south in a cabinet covered with a good grade of window glass, approximately one-eighth inch thick, and open at both sides in such a way as to allow free access of air to the specimens. The distance between the specimens and the glass shall be between one-half and one inch.
- (d) Exposure for three hours to a mercury quartz lamp. The exposed portion shall be compared with the original material and rated on the following basis:

Good, no appreciable alteration of color.

Fair, appreciable but not objectionable alteration of color.

Poor, objectionable alteration of color.

The judgment of the operator may be aided by comparison with standard samples, or material from former satisfactory purchases if these are available. They should be subjected to the above tests along with the sample under test.

A standard sample may be established for a textile material with regard to degree of fastness, provided this sample complies with the degree of fastness given in the specification for that material, as judged on the basis given above. Where a standard sample has been so established, the fastness of the material should be at least equal to that of the standard sample when subjected to the same exposure conditions.

2. Fastness to Laundering (Washing) (Cottons).—Immerse the material, braided with an equal weight of white cotton or sewed onto a piece of white cotton cloth in a solution containing one-tenth per cent neutral soap and one-tenth per cent soda at 160° F. Treat for 30 minutes, then either extract or run through squeeze rolls. Rinse well in water at 100° F. until soap and alkali are removed: treat for 10 minutes at 105° F. in one-twentieth per cent acetic acid; rinse, extract, and dry in air.

The soap should be a good grade of 88 per cent chip tallow soap and the soda ash the standard 58 per cent commercial product. The volume of solution should be about fifty times the weight of the goods.

The treated specimen shall be compared with the original material and rated on the following basis:

Good, no appreciable alteration of color.

Fair, appreciable but not objectionable alteration of color.

Poor, objectionable alteration of color.

The white material braided with or sewed onto the specimen shall

be examined to ascertain if any bleeding of the color occurred. Discoloration of the solution by the dye should be noted.

The judgment of the operator may be aided by comparison with standard samples, or material from former satisfactory purchases if these are available. They should be subjected to the above tests along with the sample under test.

A standard sample may be established for a textile material with regard to degree of fastness, provided this sample complies with the degree of fastness given in the specification for that material, as judged on the basis given above. Where a standard sample has been so established, the fastness of the material should be at least equal to that of the standard sample when subjected to the same exposure conditions.

3. Fastness to Water.—Immerse the specimen braided with an equal weight of white cotton or sewed onto a piece of white cotton cloth in tap water at room temperature for one hour.

Examine the white cotton to determine bleeding of the color and note if the water has been discolored.

# XI. SHRINKAGE TESTS (COTTON CLOTH)

On a specimen at least 12 inches square mark off a rectangle with edges parallel to the warp and filling directions and with a border of approximately 1 inch. Boil for 30 minutes. Treat in water at room temperature for 30 minutes. Extract and dry in air. Press. Measure marked-off portion. Compute warp and filling shrinkages separately.

# XII. DETERMINATION OF PER CENT SIZING OR FINISHING MATERIALS (COTTON)

Weigh a specimen of about 5 g. Remove the sizing and finishing materials by (1) extracting with ether, (2) boiling in distilled water for 10 minutes, (3) treating in a hot (90° to 95° C.) solution of sodium carbonate (0.5 per cent) for 30 minutes, (4) rinsing in distilled water, (5) immersing in a hot (85° to 90° C.) solution of hydrochloric acid (0.5 per cent) for 30 minutes, (6) rinsing in distilled water, (7) neutralizing in a 1 per cent solution of sodium carbonate at room temperature, (8) rinsing thoroughly in distilled water, and (9) drying. Weigh and compute per cent of sizing and finishing materials, using the weight of the extracted specimen as a basis.

All weighings shall be made after conditioning at 65 per cent relative humidity at 70° F. Weighings shall be made to the nearest milligram or equivalent accuracy.

# Analysis of Cloth for Tariff Purposes

Treasury Decisions 33823 and 34255

Under the provisions of paragraph 253 the rates of duty are to be ascertained according to the average number of the yarns in the condition in which imported. The length of the yarn is to be counted as equal to the distance covered by it in the cloth, all clipped threads to be measured as if continuous, and all ply yarns to be separated into singles and the count taken of the total singles; any excessive sizing to be removed by boiling or other suitable process. The number of the yarn is the English number of 840 yards to a pound for a No. 1 yarn.

The average number of the yarn may be found without unraveling the fabric, and is the quotient of the division of the total thread length by the weight in the proportion of 840 yards of yarn equaling 1 pound of 7,000 grains or 1 yard of yarn equaling 8½ grains, which is equivalent

to a No. 1 yarn.

The following simple formula may be used: Multiply the count of threads per square inch by the number of square inches in the sample used, this product to be multiplied by 100; then divide the product thus obtained by the weight of the sample in grains multiplied by 432. The quotient will give the number of the yarn. For example, take a sample of cotton cloth 4 inches square, which equals 16 square inches, having 28 warp and 28 woof threads, a total of 56 threads to the square inch, and weighing 8.6 grains. The formula applied would be as follows:

$$\frac{56 \times 16 \times 100}{8.6 \times 432}$$
 = 24, the number of the yarn.

The formula may be further simplified by weighing a square yard of said cloth and dividing the number of threads per square inch by 1/300 of the weight of a square yard in grains.

Samples of all cotton cloth should be forwarded to the United States appraiser at New York on the C. V. R. cards, under the provisions of T. D. 31936. When a square yard or more is available for test the following formula may be used:

 $\frac{\text{Number of threads per square inch} \times 24}{\text{Number of ounces per square yard} \times 35} = \text{Average number of yarn}.$ 

An addition of  $8\frac{1}{2}$  per cent to be made to bone-dry weight in ascertaining the number of the varn in cotton cloth.

## Width of Some Standard Fabrics

The following is a list of the widths on which the weight of the fabrics listed are based:

	I	nches		1	ncbes
Single and double filling ducks		29	Balata belt duck		-36
Army ducks		$28\frac{1}{2}$	Oil or stitched belt duck .		-36
Shelter tent duck .		$35\frac{1}{4}$	Numbered duck (American)		22
Shoe duck		37	Numbered duck (English) .		24
Tire duck		36	Mitten flannels		33
Hose duck		40	Ticking		-32
Rubber belt duck		42	Osnaburg		30
Enameling ducks 38, $46\frac{1}{2}$ , $51\frac{1}{2}$ , 6	$1\frac{1}{3}$	. 63

Strength of yarn in pounds = 
$$\frac{1600 (1 + or - .11a + or - .01b)}{c}$$

The above table represents the breaking strength found by testing a great many samples of yarn using the 120 yard skein after conditioning in an atmosphere containing 70 per cent relative humidity.

a = Difference in sixteenths of staple over or under one inch. Use + sign when over, - when under.

b = Difference in number of yarn above or below 28s. Use - sign when over 28s, + sign when below 28s.

c = Yarn count.

"The numbers in Roman type represent regular fabries; all others, including widths intermediate to those listed, are specials. Only the list of regular numbers and widths to be carried in stock. Specials will be made up on order only in units of not less than 500 yards; and as far as possible the manufacture of specials will be restricted to units of 1,500 yards as representing the minimum at which operating efficiency is obtainal le."

Specifications bearing only a Federal Specifications Board number and symbol number are in mimeograph form and can be obtained upon request from the Federal Specifications Board, Bureau of Standards, Washington, D. C.

Specifications marked "Printed" or those bearing Bureau of Standards circular numbers are in printed form and must be purchased from the Superintendent of Documents, Government Printing Office, Washington, D. C., at five cents each unless otherwise indicated. In requesting specifications from the Superintendent of Documents, the Bureau publication number or the new Federal symbol must be stated.

The price of each printed specification is five cents per copy, unless otherwise noted.

<sup>\*</sup> Note.—All Federal Specifications have been assigned new symbol numbers. As rapidly as the specifications are revised, the new symbol appears on the specification. The above specifications marked "Printed" have been revised and bear the new symbol.

# Contract Sales Note for Staple Gray Goods

Form approved and adopted by The National Association of Cotton Manufacturers and American Cotton Manufacturers' Association, 1910

by strikes, lockouts, or unavoidable eas accepted in proportion to the productic The provisions of paragraphs I, II ar specifications as adopted by The Amer and The National Association of Cott- back hereof, 1 are accepted and agreed t wise stated herein.  This sale note is the entire contract	e curtailed during the time above named, ualties, the deliveries shall be made and on. d III, and the allowable variations from ican Cotton Manufacturers' Association on Manufacturers, all as printed on the o as a part of this contract, unless otherbetween the buyer and seller, and any ed form of this contract must appear on
To (Sign	ued)
•	

<sup>1</sup> See following page.

Paragraph I. Passing Title on Delivery.—Unless otherwise specified, the title to goods sold passes to the buyer (subject to the right of stoppage in transitu):—

a. Upon delivery F. O. B. to carrier, consigned to buyer, and thereafter goods

are at buyer's risk.

b. Upon arrival of goods at destination and delivery to buyer of bill of lading or of goods, in the ease of goods to be delivered F. O. B. elsewhere than to earrier.

c. Upon delivery of indorsed bill of lading or of goods, in the ease of goods

consigned to seller's order.

d. Upon the separation of the goods and holding subject to buyer's order (the invoice to follow by due course of mail), in the case of goods to be held or if buyer fails to give shipping instructions.

Paragraph II. Storage and Insurance.—Goods invoiced and held subject to buyer's orders shall be at buyer's risk, but covered by fire insurance effected

by sellers in reputable companies.

Paragraph III. Rejections and Claims.—The buyer cannot reject the goods for delay in delivery unless he notifies the seller within five business days from receipt of bill of lading, or of invoice if goods are to be held. When contract calls for delivery in instalments, the buyer cannot cancel the contract for any default in any one or more instalments not amounting to a substantial breach of contract but may cancel or replace at seller's expense any delivery that is delayed.

Buyer cannot reject goods for defects in quality or other like defaults (a) if he cuts or converts them, nor (b) unless he notifies seller within ninety days from receipt by him or at finishing works of goods not held, or within ninety days after date of invoice if goods are invoiced and held; nor (c) unless such defects amount to a substantial breach of contract.

Loss of right to reject does not deprive the buyer of his right to claim damages, if any; but no recovery shall be had on any claim not made within one year

from receipt of goods or from date of invoice if goods are held.

# Allowable Variations from Contract Specifications

Width.—The width shall not vary anywhere by more than 3 s of an inch below the stipulated width, nor more than 5 s of an inch above. The width shall not be uniformly less than the stipulated width, but must, in a majority of places in each piece, be equal to, or greater than, the stipulated width. Goods shall be measured at right angles to the selvages when laid open on a flat, horizontal surface and smoothed out by hand, but not stretched.

Warp Count.—Except within four inches of each selvage, (where exclusive of the selvage, the count must approximate that stipulated) the number of warp threads per inch shall not vary anywhere by more than one thread per inch below the stipulated count, nor by more than two threads per inch above. The number of threads in each piece must equal the stipulated count multiplied

by the stipulated width plus the extra threads used in the selvage.

Filling Count.—The number of threads in the filling, or weft, shall not vary anywhere by more than three threads per inch below the stipulated count, nor by more than four above. In the case of sateens, when the count of filling exceeds the count of the warp, the allowance for variation above specified shall be increased by the same percentage that the filling count exceeds that of the warp count. In any case including sateens, the filling count per inch shall not run below the stipulated count throughout the piece, but must, in a majority of places in each piece, equal or be more than, the stipulated count.

Weight.—In ease of controversy regarding the weight of goods, decision shall be based on goods which have been exposed for twenty-four hours to normal atmospheric conditions approximating a temperature of 70 degrees F. and a

humidity of 70 per cent.

### INDIGOSOLS

## For Fast Printing and Dyeing

# CHROME PRINTING COLORS ANILINE COLORS DYESTUFFS CHEMICALS

Master Dyers and Printers have used our products for years with absolute confidence. They know that the unvarying quality of CARBIC Dyestuffs and Chemicals assure results worthy of the skill and artistry employed in their application.

### Carbic Color & Chemical Co.

INCORPORATED

451-453 WASHINGTON ST. PHILADELPHIA

**PROVIDENCE** 

NEW YORK, N. Y.
BOSTON
HAMILTON, ONT.

Sole Agents for Durand & Huguenin S. A., Basle, Switzerland

For Seventeen Years

## VICTROLYN

(Reg. U.S. Pat. Off.)

### has been in use as a Sizing Assistant for Cotton Warps

It has stood the test of time and research. Revolutionary in the simplicity and convenience of application. It has proved its case as a scientific discovery. Displacing everything but Starch and water it fulfills the functions necessary for efficient sizing in proper lubrication and penetration. Miscible in water, assuring uniformity and dependability. Concentrated (practically free from moisture) it saves freight, room and handling. Every ounce effective. Great economy in using Victrolyn is testified by long experience with it as compared to any other agent. Adapted for light or heavy sizing. As little as 2½ lbs., as much as 7 lbs. may be used with 100 lbs. of starch, according to the work. It may be rinsed out of the goods readily. A boon to bleachers as well as to weavers. Its record is based on good work and saving money. Victrolyn comes in iron drums of about 400 lbs.

We are the sole manufacturers

We also manufacture High Grade Castor Oil Products, Sulphonated and Saponified — Cotton Softeners and Sizes for Finishing — B & L Bleaching Oil, to make a foundation for a pure white — Klorasene Spot Cleaner — Monoline Oils — Pentralyn — Soluble Pine Oils — B & L Bleachers Bluings and Violet Tints

### Your Cotton Production-

Much depends upon the start you give it. Roy Cotton Card Grinders will keep your cards in good condition continuously. Furnished singly or in sets of two Improved Traverse and one Improved Roller Grinder.

The investment is small; the return well worth-while. . .

### B. S. Roy & Son Company

Established 1868

WORCESTER, MASS.

## DANVERS Bleachery & Dye Works

Owned and Operated by

Nanmkeag Steam Cotton Co.

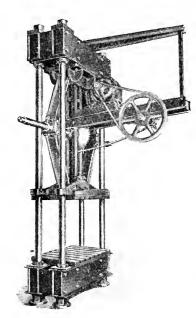

## Finishers Stitchers

Full equipment to bleach, dye and finish all classes and grades of Cotton Piece Goods, Flannels, Toweling and such specialties as Tag Cloths, Hollands or any cloth requiring high finish and gloss.

Also large equipment of sewing machines suitable for manufacture of either plain or fancy stitched towels.

H. M. SHACKELFORD, Superintendent

Office and Works PEABODY, MASS.

## Knuckle Joint BALING PRESS

60 to 500 Tons Pressure

Motor Driven by silent chain from center of screw.

**Push Button** reversing control, with limit stops up and down.

**Self Contained**, set anywhere you can run a wire.

Also Box Baling Presses and Hydraulic Baling Presses any size and pressure to do your work.
